

How To Set Up SSL in Mac Eudora

NOTE: The following screen shots and instructions were completed using Eudora version 6.2.1. Users running an older version should upgrade to the latest version available on <http://arclib.arc.nasa.gov>.

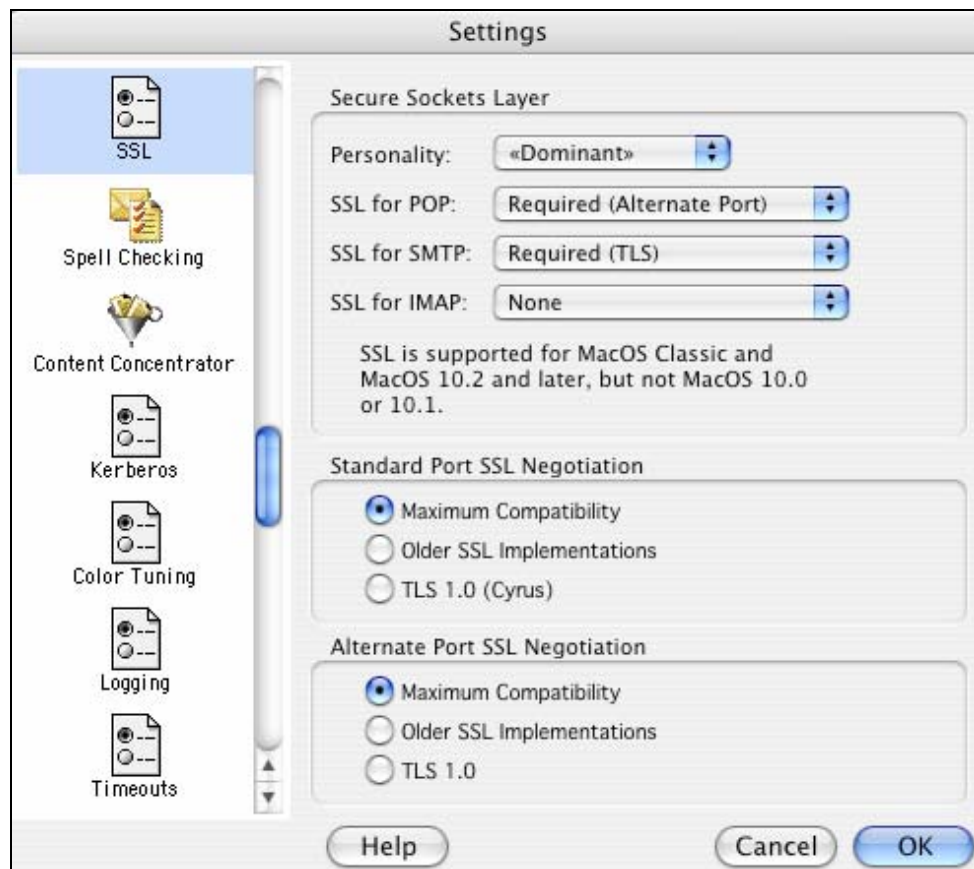

1. Open the Eudora application to begin setting the SSL options.
2. Select the “**Special**” menu and select “**Settings...**” menu item

The Settings window below will appear.

3. Click on the “SSL” icon in the left-hand area of the window. You might need to scroll up or down to find it.
4. In the Secure Sockets Layer (SSL) section, click on the pull down menu for SSL for POP and select **Required (Alternate Port)**.
5. In the Secure Sockets Layer (SSL) section, click on the pull down menu for SSL for SMTP and select **Required (TLS)**.
6. The settings should now look like the below picture.

7. Click the “OK” button.
8. You have completed configuring the Mac Eudora client for checking and sending mail using SSL.
